

CASE STUDY

Storage search and find facility.

Transfer of business critical information to an information management platform.

INDUSTRY

Life Sciences and BioMedical

NEED

InterCell BioMedical previously stored all documents in an unstructured and disparate fashion. InterCell needed an easy method of storing key company information within a secure, searchable and structured environment facilitating the location and management of important business information by:

1. Enabling document collaboration
2. Providing enterprise search capabilities.

BUSINESS CHALLENGE

InterCell's previous system presented many difficulties for intra-department information sharing. We had to re-educate key users to take ownership of their individual work areas and engage information workers within these new processes.

SOLUTION

Brantas implemented a solution that inherited the benefits of the previous system supplemented with enhanced searching, security and document

sharing features whilst mitigating the risk of users removing key company information. We retained existing corporate styling and identity when designing the new management system and successfully engaged key users in the new platform through tailored workshops. We matured InterCell's business continuity plan by implementing a strategy to minimize the likelihood of information loss down to the smallest acceptable limit to the business utilising current infrastructure therefore minimizing the cost of ownership.

RESULTS

- Business continuity improvements.
- 95% reduction in the time taken to search for business relevant information.
- Facilitate secure remote working using existing infrastructure.

CORE TECHNOLOGIES

Microsoft Office SharePoint Server 2007
.NET technologies
SQL Server
XHTML / CSS

“Brantas helped us realise our concept in an exceptionally tight timescale. We were able to deliver real improvements in document management and enterprise level search with minimum impact on the business.”
